Verifying MinimalCaps' Security Guarantees

Future Work

# Introduction

Traditionally:

- Long manuals
- Prose

Recently:

- Formal & executable spec

# Security Guarantees

## Example: Intel SGX

“The SGX1 extensions allow an application to instantiate a protected container, referred to as an enclave. The enclave is a **trusted area of memory**, where critical aspects of the application functionality have hardware-enhanced **confidentiality** and **integrity protections**. New access controls to **restrict access** to software not resident in the enclave are also introduced. The SGX2 extensions allow additional flexibility in runtime management of enclave resources and thread execution within an enclave.”

- Intel® 64 and IA-32 Architectures Software Developer’s Manual Volume 3D

# Security Guarantees

## Example: AMD64

“Only privileged software running at CPL=0 can manage the TLBs.”

“Page translation is controlled by the PG bit in CR0 (bit 31). When CR0.PG is set to 1, page translation is enabled.”

“Most instructions used to access these resources are privileged and can only be executed while the processor is running at CPL=0, although some instructions can be executed at any privilege level.”

- AMD64 Architecture Programmer's Manual Volume 2: System Programming

# Security Guarantees

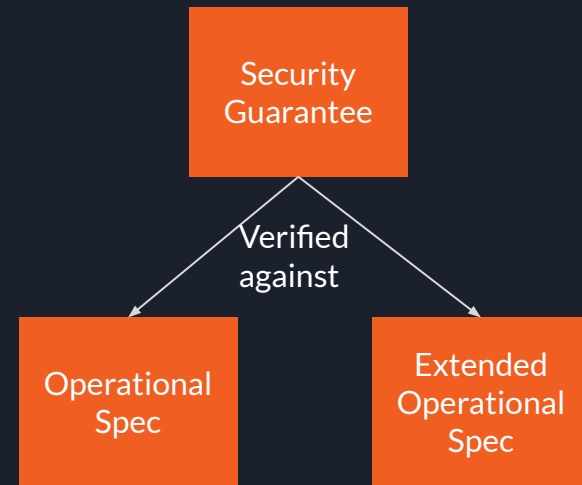

## Current Approach

- Informal ISA specs offer *promise* of security guarantee
  - “Security guarantee *X* offers *Y* / prevents attack *Z*”
  - Holds for future updates to the ISA
- Formal ISA specs *lack* security specifications
  - Focus is on operational specification

# Universal Contracts

## Motivation

- Security guarantees should be
  - Part of ISA specification
  - Formal
  - Verifiable against operational spec
  - Specific enough for reasoning
  - Not overspecified
    - Optimizations and extensions should be possible
- Current approaches do *not* meet these requirements

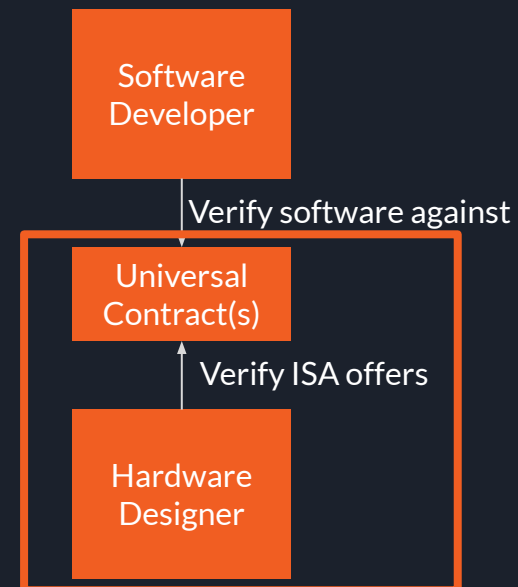

# Universal Contracts

## Concept

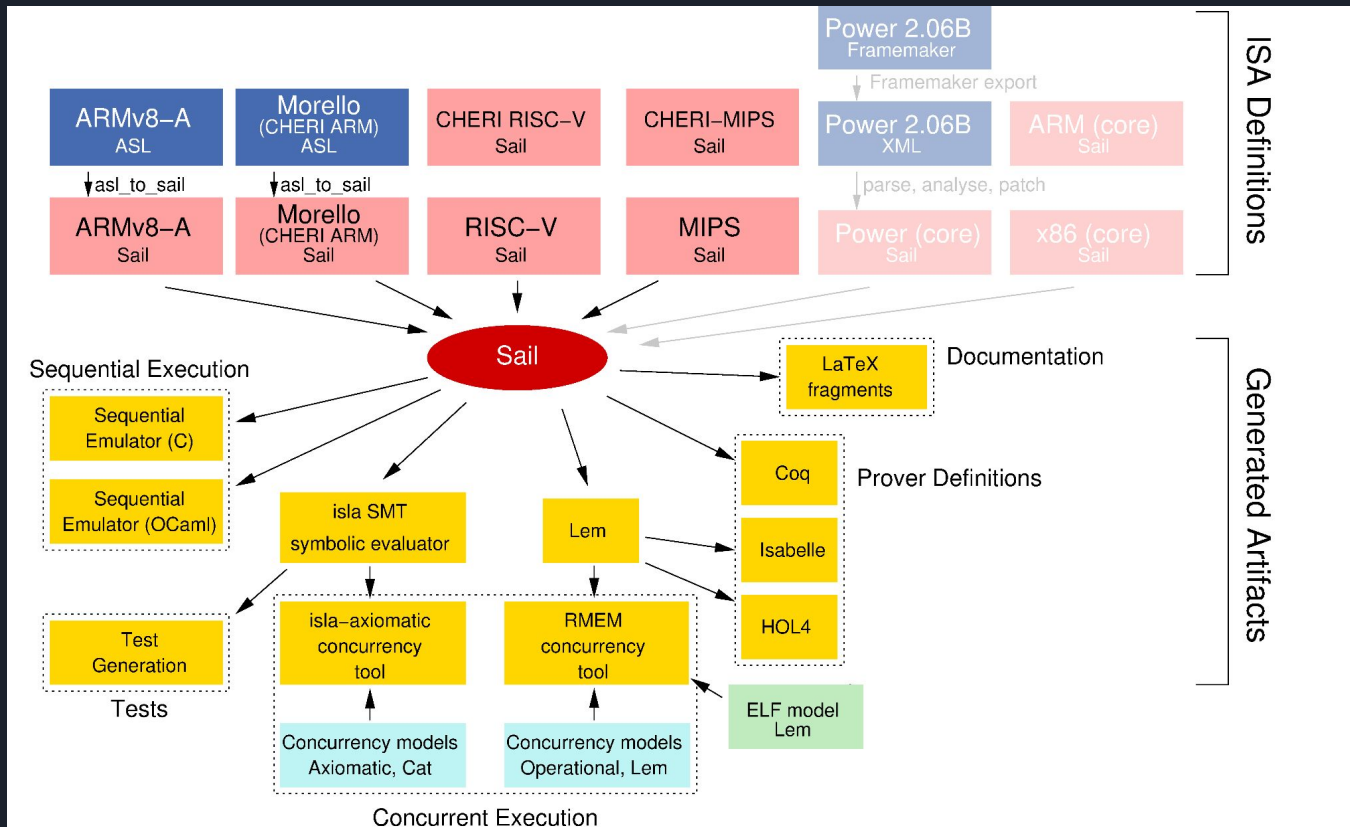

**{{ security guarantee }}** `ASM code` **{{ security guarantee }}**

- Formal security guarantee...
- ... expressed as a contract
  - Upper bound of the authority
- Holds for *any* code
- Verifiable against operational specification of ISA
  - Sail

# Sail

# The MinimalCaps Capability Machine

## Capability

- $perm \in \{O, R, RW\}$
- `begin` : address
- `cursor` : address
- `end` : address

## Hardware Guarantees

- Capabilities are unforgeable
- Permissions are checked
- Capability manipulation is safe

# Capability Safety

## Machine Invariant

$$(\exists c, pc \mapsto c * \mathcal{V}(c)) * (\forall r \in \text{GPR}. \exists w. r \mapsto w * \mathcal{V}(w))$$

## Logical Relation $\mathcal{V}$

$$\mathcal{V}(w) \begin{cases} \mathcal{V}(z) & = \text{True (z is an integer)} \\ \mathcal{V}(O, -, -, -) & = \text{True} \\ \mathcal{V}(R, b, e, -) & = *_{a \in [b, e]} \exists \boxed{w, a \mapsto w * \mathcal{V}(w)} \\ \mathcal{V}(RW, b, e, -) & = *_{a \in [b, e]} \exists \boxed{w, a \mapsto w * \mathcal{V}(w)} \end{cases}$$

# Contract

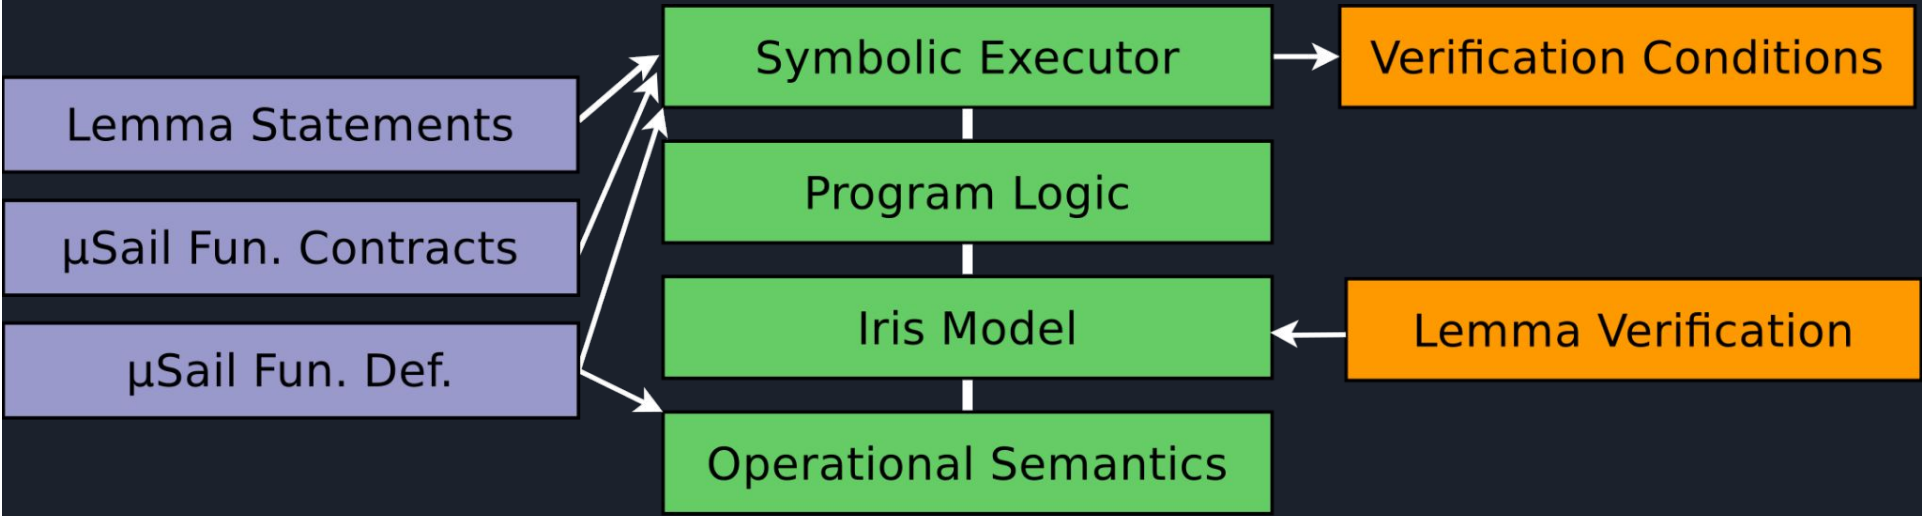

## Execute

```
{{ (∃ c . pc ↦ c * V(c)) * (∀ r ∈ GPR . ∃ w . r ↦ w * V(w)) }}  
function execute() : bool :=  
  let c := call read_reg_cap pc in  
  let n := call read_mem c in  
  match n with  
  | inl n =>  
    let i := call decode n in  
    call exec_instr i  
  | inr c => fail  
  end  
{{ (∃ c . pc ↦ c * V(c)) * (∀ r ∈ GPR . ∃ w . r ↦ w * V(w)) }}
```

  true  
{{ (∃ c . pc ↦ c * V(c)) * (∀ r ∈ GPR . ∃ w . r ↦ w * V(w)) }}
```

# Future Work

Accomplished goals

Currently working on

## Conclusion

- Security Guarantees
  - Formalized with Universal Contracts
  - Part of *security guarantee* specification
  - Verified against *operational* specification
- Case Study: MinimalCaps
  - Capability safety
- Katamaran
  - Semi-automatic separation logic verifier

Thank you!
